

# MIT-IIT Robotics Program

## Logic Flow – Booleans, Logical & Relational Operators, Conditionals, While Loops

Amartya Shankha Biswas

May 28, 2017

# Outline

- 1 Recap
- 2 Logical Expressions
  - Booleans
  - New Operators
- 3 Conditionals
  - If Else Statements
  - Nested Conditionals
  - Exercises
- 4 Loops
  - While Loop
  - Counters
  - Exercises

# Outline

# Booleans

## A New Data Type

Booleans only have two possible values – True or False

# Booleans

## A New Data Type

Booleans only have two possible values – True or False

**Statement:** Schrodinger's cat is dead !

# Booleans

## A New Data Type

- In C++ we have a **bool** data-type

```
bool var = true;
```

# Booleans

## A New Data Type

- In C++ we have a **bool** data-type

```
bool var = true;
```
- Actually stored as integer (**true** is 1 and **false** is 0)

# Booleans

## A New Data Type

- In C++ we have a **bool** data-type

```
bool var = true;
```

- Actually stored as integer (**true** is 1 and **false** is 0)
- In the other direction
  - Zero value is **true**
  - Non-Zero value is **false**

# Outline

## 1 Recap

## 2 Logical Expressions

- Booleans
- New Operators

## 3 Conditionals

- If Else Statements
- Nested Conditionals
- Exercises

## 4 Loops

- While Loop
- Counters
- Exercises

# Relational Operators

Operation	Common Symbol	C++ Symbol	Expression
Equals	=	==	$(a == b)$
Not Equals	$\neq$	!=	$(a != b)$

# Relational Operators

Operation	Common Symbol	C++ Symbol	Expression
Equals	$=$	<code>==</code>	$(a == b)$
Not Equals	$\neq$	<code>!=</code>	$(a != b)$
Less Than	$<$	<code>&lt;</code>	$(a < b)$
Greater Than	$>$	<code>&gt;</code>	$(a > b)$
Less Than Equals	$\leq$	<code>&lt;=</code>	$(a \leq b)$
Greater Than Equals	$\geq$	<code>&gt;=</code>	$(a \geq b)$

# Logical Operators

Operation	Symbol	Expression
And	<code>&amp;&amp;</code>	$(a \neq b) \ \&\& \ (a \% 2 == 0)$
Or	<code>  </code>	$(a > b) \    \ (a/2 > 4)$
Not	<code>!</code>	$!(a == b)$

# Outline

- 1 Recap
- 2 Logical Expressions
  - Booleans
  - New Operators
- 3 Conditionals
  - If Else Statements
  - Nested Conditionals
  - Exercises
- 4 Loops
  - While Loop
  - Counters
  - Exercises

# If and Else

The **else** statement is optional.

```
if (temperature >= 38)
    cout << "Buy an ice ceam cone" << endl;
```

# If and Else

The **else** statement is optional.

```
if (temperature >= 38)
    cout << "Buy an ice cream cone" << endl;
else
    cout << "Buy a lollipop" << endl;
```

# If and Else

The **else** statement is optional.

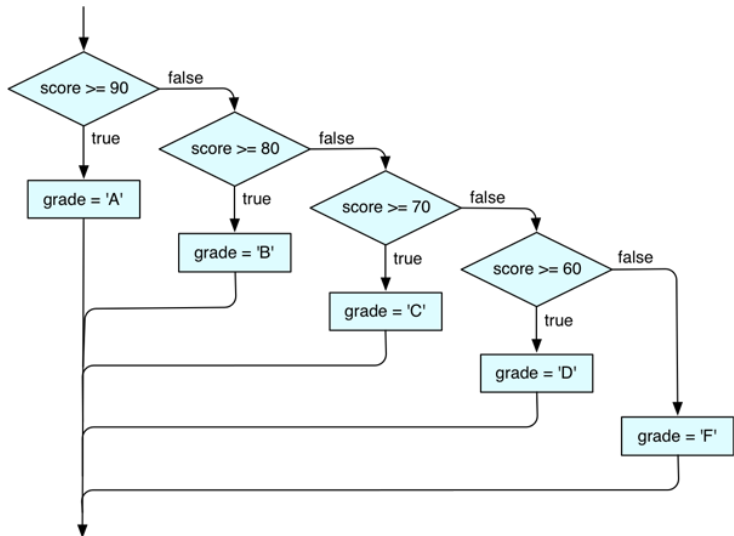

```
if (temperature >= 38)
    cout << "Buy an ice cream cone" << endl;
else
    cout << "Buy a lollipop" << endl;
```

Must use a block (surrounded by curly braces) for more than one line.

```
if (number_of_lines > 1) {
    cout << "More than one line.";
    cout << "Have to use a block.";
}
else {
    cout << "Curly braces are optional.";
}
```

# The if...else if...else Statement

# The if...else if...else Statement

To test multiple conditions, we can cascade if statements

```
if (temperature >= 35) {  
    cout << "Buy an ice cream cone" << endl;  
}  
else if (temperature >= 25) {  
    cout << "Buy a lollipop" << endl;  
}  
else if (temperature >= 15) {  
    cout << "Buy a coffee" << endl;  
}  
else {  
    cout << "Buy a sweater !" << endl;  
}
```

# The **if...else if...else** Statement

- The first statement must be an **if**.

# The **if...else if...else** Statement

- The first statement must be an **if**.
- After this, there can be any number of **else if** statements.

# The **if...else if...else** Statement

- The first statement must be an **if**.
- After this, there can be any number of **else if** statements.
- At the end, there can be one (or zero) **else** statement.

# Outline

## 1 Recap

# Nested Conditionals

# Nested Conditionals

```
if (temperature >= 35) {  
    if (money >= 45) {  
        cout << "Buy a Cornetto" << endl;  
        money -= 45;  
        if (money > 0) {  
            cout << "Buy a candy" << endl;  
        }  
        else  
            cout << "Out of Money :(" << endl;  
    }  
    else  
        cout << "Buy a Pepsi" << endl;  
}  
else {  
    cout << "Buy a lollipop" << endl;  
}
```

# Outline

# Lab Time !

Write programs for each of the following specifications

Input	Output
Four integers	Maximum and second max value
Cutoff for A, B, C grades, and also marks of one student (out of 100)	Whether the cutoffs are valid, and what grade the student received.
Three points (vertices of triangle) in terms of $(x, y)$ coordinates	Whether the triangle is equilateral, isosceles, or scalene

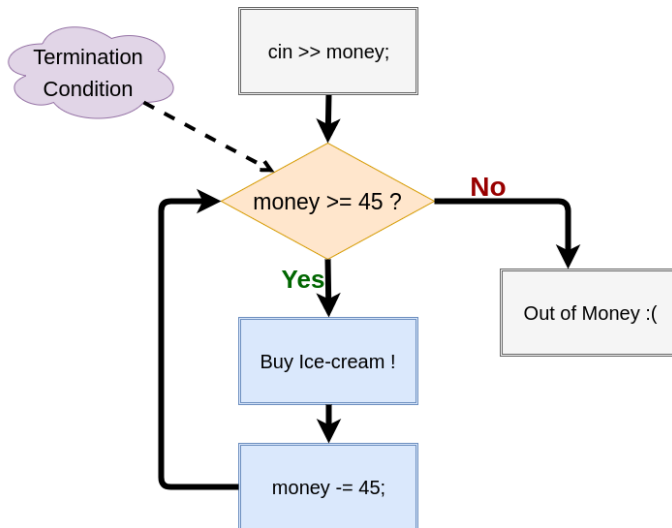

## Age Guessing Game

Write a program that asks the user questions of the form "Is your age less than 50". The user can only respond with 1 (yes) or 0 (no).

Challenge – Guess age in seven questions or less.

# Iteration

Repeat the Same Instructions many times

# Outline

- 1 Recap
- 2 Logical Expressions
  - Booleans
  - New Operators
- 3 **Conditionals**
  - **If Else Statements**
  - Nested Conditionals
  - Exercises
- 4 Loops
  - While Loop
  - Counters
  - Exercises

# While Loop

```
cin >> money;
while (money >= 45){
    cout << "Buy an ice ceam cone" << endl;
    money -= 45;
    cout << "Money remaining: " << money << endl;
}
cout << "Out of Money" << endl;
```

# While Loop

```
cin >> money;
while (money >= 45){
    cout << "Buy an ice ceam cone" << endl;
    money -= 45;
    cout << "Money remaining: " << money << endl;
}
cout << "Out of Money" << endl;
```

If the input *money* is 200, this results in the following output.

```
Buy an ice ceam cone
Money remaining: 155
Buy an ice ceam cone
Money remaining: 110
Buy an ice ceam cone
Money remaining: 65
Buy an ice ceam cone
Money remaining: 20
```

## Compare this to the If Statement

```
cin >> money;
if (money >= 45){
    cout << "Buy an ice ceam cone" << endl;
    money -= 45;
    cout << "Money remaining: " << money << endl;
}
cout << "Out of Money" << endl;
```

If the input *money* is 200, this results in the following output.

```
Buy an ice ceam cone
Money remaining: 155
```

# While Loop

```
cin >> money;
while (money >= 45){
    cout << "Buy an ice ceam cone" << endl;
    money -= 45;
    cout << "Money remaining: " << money << endl;
}
cout << "Out of Money" << endl;
```

If the input *money* is 200, this results in the following output.

```
Buy an ice ceam cone
Money remaining: 155
Buy an ice ceam cone
Money remaining: 110
. . .
```

# Outline

# Unknown Number of Inputs

- User specifies the number of inputs
  - Take  $N$  inputs and arrange them in ascending order.
  - Find the average of  $N$  numbers

# Unknown Number of Inputs

- User specifies the number of inputs
  - Take  $N$  inputs and arrange them in ascending order.
  - Find the average of  $N$  numbers
- Thoughts ?

# Unknown Number of Inputs

- User specifies the number of inputs
  - Take  $N$  inputs and arrange them in ascending order.
  - Find the average of  $N$  numbers
- Thoughts ?
- Use a counter variable
  - Initialize counter to zero

```
int counter = 0;
```

# Unknown Number of Inputs

- User specifies the number of inputs
  - Take  $N$  inputs and arrange them in ascending order.
  - Find the average of  $N$  numbers

- Thoughts ?

- Use a counter variable
  - Initialize counter to zero

```
int counter = 0;
```

- Increment counter at every loop iteration

```
counter += 1; OR counter++;
```

# Unknown Number of Inputs

- User specifies the number of inputs
  - Take  $N$  inputs and arrange them in ascending order.
  - Find the average of  $N$  numbers

- Thoughts ?

- Use a counter variable
  - Initialize counter to zero

```
int counter = 0;
```

- Increment counter at every loop iteration

```
counter += 1; OR counter++;
```

- Terminate when counter hits  $N$

```
while (counter < N) { . . . }
```

# Using a Counter

```
int counter = 0, N;  
cin >> N;                                //Number of inputs  
while (counter < N) {  
    // Body of Loop. Take input, process data etc . .  
    counter++;                            //Increment Counter  
    cout << "Counter Value:" << counter << endl;  
}  
cout << "Exited Loop\n";
```

## Using a Counter

```
int counter = 0, N;  
cin >> N;                                //Number of inputs  
while (counter < N) {  
    // Body of Loop. Take input, process data etc . .  
    counter++;                            //Increment Counter  
    cout << "Counter Value:" << counter << endl;  
}  
cout << "Exited Loop\n";
```

If the input  $N$  is 6, this results in the following output.

```
Counter Value:1  
Counter Value:2  
Counter Value:3  
Counter Value:4  
Counter Value:5  
Counter Value:6  
Exited Loop
```
